### Project Challenges
- 60” RCP required slip lining
- Needed to bind host pipe and new pipe to ensure slippage does not occur
- Soils adjacent to host pipe were being washed into the pipe and required void fill and stabilization

### Solution
- Seal annular void space between slip lined pipes
- Expanding polymer will seek out corroded areas of host pipe, travel outside to void-full and stabilize soils

### Support
- Specifications
- Designed injection port quantity and depth
- Pre-construction meeting
- On-site installation

### Outcome
- **Project completed**: Good tight seal achieved between host pipe and new pipe
